

Project Report

Project: Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Date	02 October 2026
Team ID	SWTID-2026-5694
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Team Leader	Praveen Karthik R
Team Members	Praveen Karthik R, S Madhan, Balaji SS, SARANYA SRI VALLI D
Platform	ServiceNow
Maximum Marks	As per reference template

1. Introduction

1.1 Project Overview

- A user submits a Standard Laptop catalog request. After the Service Request is approved, the Flow Designer workflow creates a Catalog Task. The task uses the Request Item record, has the short description "Laptop need to Configured", has the description "Laptop need to Configured", and is assigned to the Hardware group.

1.2 Purpose

- The purpose is to reduce manual effort in the post-approval task handoff for standard laptop procurement.

2. Ideation Phase

2.1 Problem Statement

- The standard laptop request process requires a configuration task after approval. Manual creation and assignment can add overhead and introduce avoidable delays.

2.2 User Story

- As a member of the IT procurement team, I want a streamlined process for ordering standard laptops so that tasks are automatically generated and assigned to the hardware team for configuration.

3. Objectives

- Create a Catalog Task after approval of the Service Request.
- Use the Requested Item record as the task request item.
- Set the task short description and description to "Laptop need to Configured".
- Assign the task to the Hardware group.
- Reduce manual task creation and improve consistency of task handoff.

4. Proposed Implementation

The flow is named "Standard laptop task", uses the Global application and System user execution context, has a Service Catalog trigger, and uses the Create Catalog Task action. The task fields are configured as described in the project instruction document.

5. Expected Benefits

The workflow is intended to reduce manual intervention, reduce the chance of a missed task handoff, and improve task routing to the Hardware group. These are expected benefits, not measured outcomes.

6. Testing and Results

Testing should verify trigger execution, task creation, field mapping, assignment group, and behavior for an approved request. Actual results, screenshots, and sign-off were not supplied; they must be added after execution.

7. Conclusion

The project defines a ServiceNow Flow Designer workflow for creating a laptop configuration Catalog Task after request approval. Completion and effectiveness should be confirmed through execution evidence and stakeholder validation.
